

JANUARY

- Dormant under snow for the winter. Keep traffic off the frozen turf to protect the crowns.

FEBRUARY

- Still dormant through the deep freeze, nothing to do but let it rest.

MARCH

- Snowpack melts this month. Stay off the muddy turf to avoid deep ruts and compaction.

APRIL

- Good time for a soil test (every 2-3 years). Zone-3's short summer needs every extra week to break down lime before the fall freeze.
- Gently rake the matted grass to break up any snow-mold webs.
- Spring green-up is underway.

MAY

- Soil nearing 55°F? Time for your spring pre-emergent.
- First light feeding of the year (~0.5 lb N) to fuel spring recovery.

JUNE

- Spot-treat broadleaf weeds, but only once air temps hold above 65°F. A cold spray just gets wasted.
[WEED ID TOOL → TURFTRIGGER.COM/TOOLS](https://turftrigger.com/tools)
- Good window for preventative grub control, June through July.
- Raise your mower to 3" + to help the lawn handle summer heat.

JULY

- Water deeply and infrequently, about 1"/week, to help keep the lawn out of heat dormancy.

AUGUST

- Good time to scout for grubs.
- Once the heat breaks in late August, it's a good time to core aerate.
- Seed bare spots only. KBG fills in thin areas naturally through its rhizomes.

SEPTEMBER

- Time for your primary fall feeding, the year's heaviest (~1 lb N), to fuel rhizome spread.
- A second broadleaf weed pass works well now. Fall applications push the herbicide deep into perennial roots.

OCTOBER

- Gradually drop your mowing height to ~2.5" to help prevent snow-mold matting.
- Once top-growth stops but the grass is still green, apply a fast-release winterizer.
- If you've had snow mold before, this is the time for a preventative fungicide (propiconazole).

NOVEMBER

- Ground freezes and the turf settles into full dormancy.

DECEMBER

- Dormant under snow, nothing to do until spring.

Good to know

Cool-season grass in USDA zone 3. Ultra-short growing season requires earliest possible soil testing and strict spring mud traffic control.
